

Abstract

The invention relates to a method and system for transmitting service data between telecommunication devices (10,18), pre-paid access data comprising a first digital key and control data being stored in a memory module
5 (11) of a telecommunication device (10), a second digital key being stored on one or more control units (16) of the telecommunication network (14), a validity criterion being determined based on control data, and service data of the first telecommunication device being encoded by means of the first key as long as the validity criterion is fulfilled, and the encoded service data being transmitted
10 to the control unit (16), being decoded by means of the second digital key, and being transmitted to another telecommunication device (18).
